Build an intelligent virtual travel agent that transforms a traveller's intent into a personalized, actionable travel itinerary. The agent should understand travel preferences, budget, dates, interests, and constraints through natural conversation, asking relevant follow-up questions to clarify the traveller's needs. It should recommend destinations and create itineraries combining hotels, flights, transfers, sightseeing, and other travel experiences, tailored to each traveller's preferences.

Go beyond a traditional travel chatbot by building an agentic experience that can discover and compare travel options, validate prices and availability, estimate overall trip costs, and dynamically refine itineraries as preferences or constraints change. The agent should support the journey beyond booking by helping traveller's manage their trips, retrieve booking confirmations and vouchers, answer questions about reservations, and handle post-booking needs such as cancellations, modifications, rebooking, and travel disruptions. It should coordinate these workflows across multiple travel products, explain available options and implications, and seek user confirmation before executing consequential actions.

The ultimate goal is to create a virtual travel agent that acts like a knowledgeable human consultant throughout the entire travel lifecycle — from inspiration and planning to booking, trip management, and post-booking support. Teams are encouraged to demonstrate a working end-to-end prototype using real or simulated travel APIs, with emphasis on personalization, intelligent automation, seamless orchestration, reliability, and user experience.
