TBO integrates inventory from multiple suppliers across Sightseeing and Hotels, creating opportunities to improve inventory quality, product matching, supplier selection, and search-result ranking.

Sightseeing: Identify duplicate or equivalent attractions, tours, and experiences across suppliers while distinguishing products with different inclusions, such as transfers, meals, activity options, duration, access types, and cancellation policies. Enable accurate product matching and comparison without losing meaningful differences between experiences. Optimize listing-page ranking to highlight the most relevant and recommended experiences.

Hotels: Identify and consolidate duplicate hotel listings across suppliers, map equivalent room types, enrich property content and images, and enable accurate comparison of bookable options based on price, availability, cancellation policies, payment terms, and supplier reliability. Optimize listing-page ranking to highlight the most relevant and recommended hotels.

Objective: Develop innovative solutions to optimize multi-supplier inventory, improve product discoverability and listing-page ranking, increase price competitiveness, and drive higher booking conversion across both Sightseeing and Hotels.
